ABSTRACT OF THE DISCLOSURE:

The Graphic Object Interface (GOI) integrates supporting documents with the drawings & specifications that they represent. This integration of often bulky and cumbersome information into a single system computer run program allows all individuals associated with the maintenance upkeep & troubleshooting of the equipment, building or other item to be managed to have a comprehensive source of information available to them as well as reducing the overall need for paper products and storage space.

It is a self-booting system that runs on a MAC or PC with Software contained on the disk so it will be independent from any computer operating system & software previously installed on the host computer, therefore insuring compatibility with any future operating systems & software, but also may be started from licensed software installed on the user's computer.
